

PROCESS

The work started by exploring a way to preserve the intricate patterns of lace I had inherited. The way lace is build up reminded me of cell structures, and thus began the experimentation of bringing these fascinating structures from inside to the outside. I explored many different techniques, embroidery, silk-screening, laser-cutting & knitting. Every next step informed by what I had just created, I let the material lead itself.

At the TextileLab I explored these cell structures further using their industrial knitting machines. By focusing on creating large floats, and by combing elastic and nylon yarns, I was able to make fabrics that not only mimicked their inspiration, but started to behave in unexpected ways all on their own.

I had experienced emergence, and focused on showing the type of "life" I had now created. The life being shown in a short film, and the specimens reexamined in a student lab set-up at the Textile museum exhibition.
