

PROCESS

The project began by abstracting ornamental forms from the music into a consistent visual language. Using circles and the curves they generated as the only construction elements, I developed decorative motifs that gradually transformed into letterforms. While these worked as individual characters, the resulting typeface lacked consistency when used as running text. I also explored alternative systems based on liquified grids and geometric star patterns before changing direction entirely.

Instead of refining a conventional font, I designed a multidirectional script built upon a fixed grid. Each character occupies the same framework and can be read from any orientation, with a dedicated calibration glyph indicating the correct reading direction. This system prompted questions about the world in which such a script could exist, becoming the foundation for the speculative setting developed throughout the project. The script was ultimately applied to the museum labels accompanying the architectural artefact, strengthening the illusion of a discovered language and culture.
