

PROCESS

The animation was created in Blender as a sequence of five interconnected scenes, each revealing another fragment of the fictional world. A restrained palette of black, white, and red was used throughout, inspired by the colours the music evoked during the initial research. Beyond their aesthetic role, the colours became narrative devices: white representing the discovered artefacts, black concealing the unknown, and a sweeping red light gradually revealing information while leaving other elements hidden.

The script, architectural model, museum presentation, excavation site, and symbolic moon were translated into cinematic environments connected through hard cuts and controlled camera movement. As the animation progresses, fragments of the world's history begin to emerge without ever being fully explained. The final scene leaves the viewer with an open-ended interpretation, allowing the speculative narrative to remain unresolved while uniting the graphic, spatial, and atmospheric research into a single visual experience.
