

THE SOUND OF THE INCOMING PAST

The Sound of the Incoming Past explores how time-based media can be used to investigate speculative futures. Inspired by research into long-term nuclear waste warning systems, the project imagines a future in which the original meaning of these monuments has been lost. Through a first-person animated journey and an immersive sound installation, the viewer experiences a landscape intended to communicate danger across thousands of years, raising questions about memory, communication, and the ways societies leave messages for those who come long after them.
